

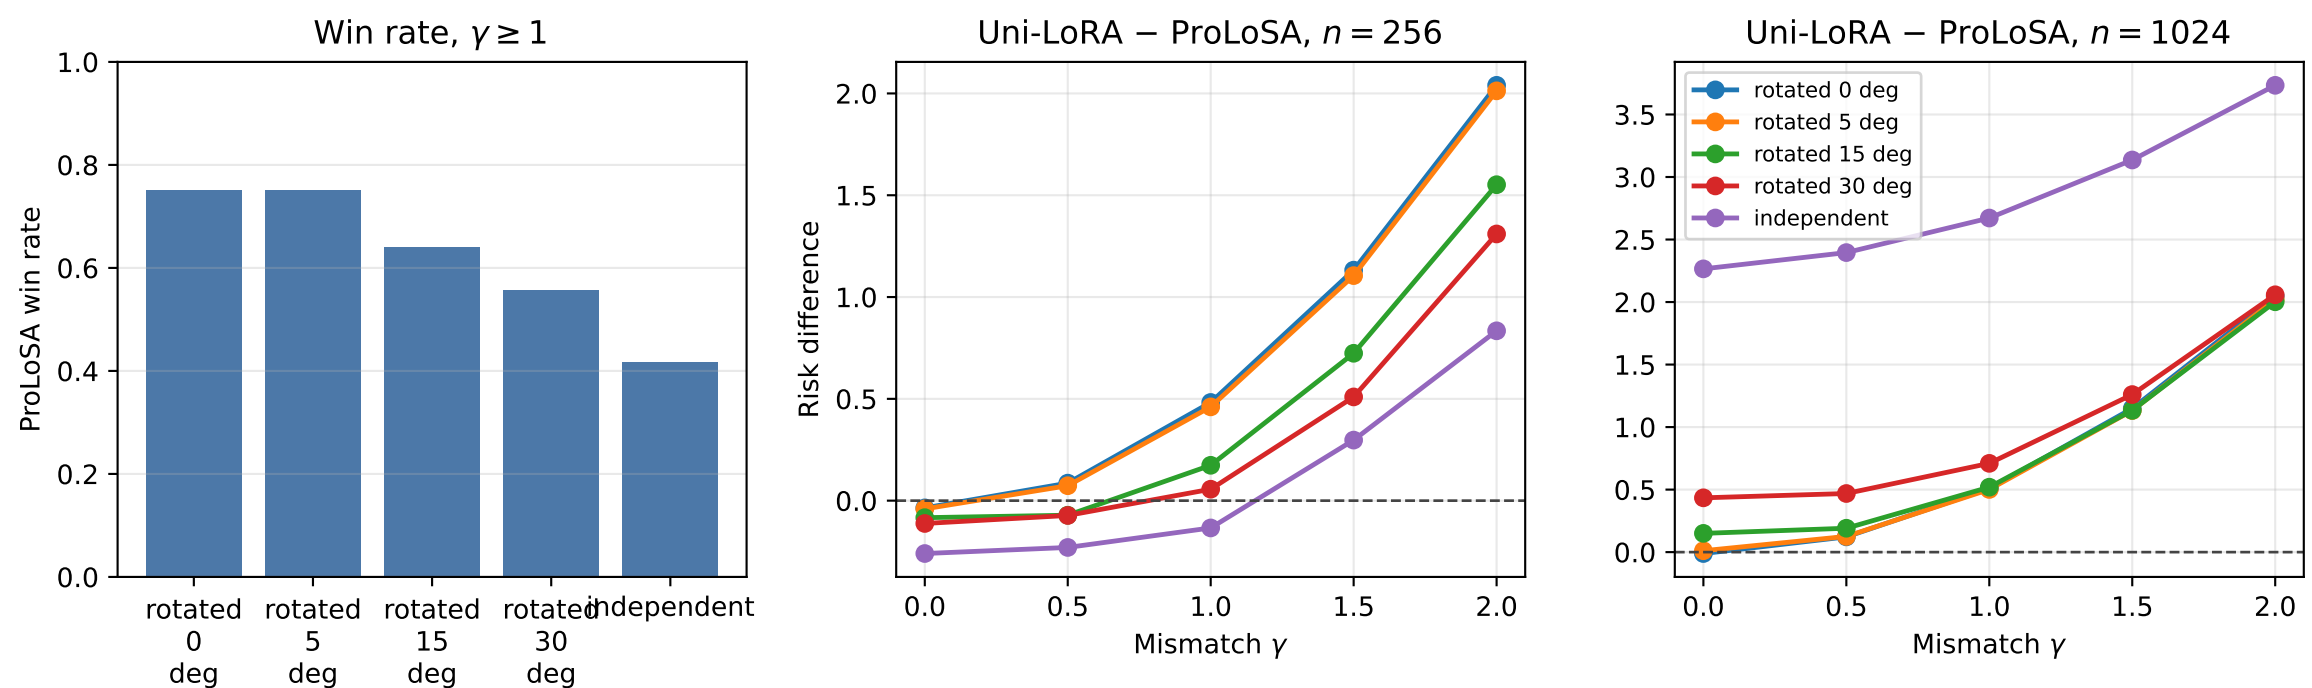

Figure S3: Projection-mismatch robustness in the Hidden-P setting. Left: ProLoSA win rate over UniLoRA for $\gamma \geq 1$ across all sample sizes and noise levels. Middle and right: Uni-LoRA minus ProLoSA risk at noise std 0.5 for $n=256$ and $n=1024$; values above zero indicate that ProLoSA is better. Independent P_M is an extreme random-subspace stress test.
